

Snowflake Data Masking Mini Project

Objective Implement dynamic data masking in Snowflake to protect sensitive employee information.

Steps 1. Create Roles and Users 2. Create Database and Schema 3. Create Employee Table 4. Create Masking Policies (Email and Salary) 5. Apply Masking Policies 6. Test Masking with Different Roles

Expected Results - FULL_ACCESS_ROLE sees full data. - LIMITED_ACCESS_ROLE sees masked email and null salary.

Verification Execute SELECT queries under both roles and compare results.

GitHub Setup Run these commands in your project folder: git init git add . git commit -m "Initial commit - Snowflake Data Masking Project" git branch -M main git remote add origin https://github.com/snowflake_data_masking_project.git git push -u origin main

FAQ Highlights - Masking works dynamically based on CURRENT_ROLE(). - Same masking policy can be applied to multiple columns. - Combine masking and row access policies for better security.
